Charles Batchelor Notebook, Cat. 1306

This notebook covers the period September 1883-July 1884. Most of the entries are by Charles Batchelor. The book contains notes, drawings, calculations, and graphs relating to lamps and dynamos. There are approximately 120 unnumbered pages.

1. Friction Metal.

Metal for heavy weights & high speed.

Tin	35

Lead	10
Antimony	5
	100

Antifriction metal

Copper	5
Zinc	85
Antimony	10
	100

---

2. Sept 4 1883

Section wire in armature –

In armatures made with wires you must have a section of wire 0·18 mm for each lamp of ·75 ampere then

Lamps	Section	Amperes
1	·18	·75
6	1·	4·5
1·25	·225	1

3. Unit of Magnetic field Jan 1884

that strength of field that will give 1 volt in 1 metre of wire cutting it at 1 metre in 1 second

M = unit of magnetism

L = total length of wire that cuts the field of force and it is found by. length of field × 2 × number of blocks ÷ 2 if multiple used

V = Velocity of cutting speed turns Rev × Diameter ÷ 60 for second.

then $E = M \times L \times V$

and $M = \frac{E}{L \times V}$

Now as 200 light gives 110 volts at 1200 turns we can get the magnetism from the following:-

$$\cancel{M = \frac{110}{280 \times 2 \times 14} \times \frac{1200 \times \cdot 246}{60}}$$

$$M = \frac{E}{L \times V} = 110 \div \left(\frac{\cdot 280 \times 2 \times 14}{2}\right) \times \left(\frac{1200 \times \cdot 246}{60}\right) = \frac{110}{101 \cdot 5} \text{ or about } 1 \cdot 08$$

Now the magnetism of the old 60 light L would be as follows:-

$M = \frac{E}{L \times V} = 110$ ohms

$$\frac{\cdot 24 \times 4 \times 44}{2} \times \frac{1200 \times \cdot 251}{60} =$$

$$\frac{110}{178 \cdot 31} = \text{about } \cdot 62\%.$$

In the 200 light the percentage of Section of Core to section of head is 56% and the current passed round the magnet is

$$\frac{110}{45} \times 14 = 34 \cdot 16 \text{ amperes.}$$

In the old L the percentage is

$$\frac{213820}{60240} = 35\tfrac{1}{2}\%$$

and the current passed round the magnet was

$$\frac{110}{42} \times 4 = 18 \cdot 34 \text{ amperes.}$$

New 100 light machine

Quest. 1 Have we enough section for lamp?

Yes. C = 75 amperes. we have 6 wires 2 times round of 14/10 =

1·53 × 6 = 9·18 + 9·18 = 18·36

75 Amperes ÷ 18·36 = 4 amperes about

Dia = 1·08 then

$E = M \times L \times V =$

$= 1{\cdot}08 \times \frac{250 \times 2 \times 64 \times 1350 \times 748}{2 \quad 60} =$

1·08 × 16 × 3·35 = Volts 8·4·54

I forgot that the wire is twice round + then divided by 2

= Volts 15·08

4 New 100 light Dynamo.

Feb. 20 1884

Armature :-

64 Blocks.

6 Wires of 14/10 twice round

Iron core 250 × 148

Magnet :. 250 × 150 cast Corners of 50 mm radius –

Section 35354

Section of armature iron cut away 37848. therefore percentage is $\frac{35354}{37848} = 91\%$

Current round magnet is 27 amperes or 4·84 × 16 layers.

Length of magnet.

60 ohms of 12/10 = 70·24 metre

× 60 = 4214 metre.

or 210·7 metre for each coil

$\frac{210{\cdot}7}{15} = 14{\cdot}0$ metre each layer

Perimeter of core with 1/2 layers on = ·789

$\frac{110 \text{ metre}}{\cdot 789} = 144$ turns.

·0112 + ·0004 × 144 = ·283 length of core.

Copper on magnets 42 Miles or ·420 per amp.

Calculation for incandescent lamp.

Take the ~~[illegible]~~ formation of a lamp of n candles at e volts when you have the measure of one of n candles and E volts then $e\,i\,n$ $s = a\,b\,l$ lamp given

" $E\,I\,R$ $S = A\,B\,L$ lamp to find

The luminous intensity must be the same the density of the current must be the same as $\frac{S}{I} = \frac{s}{i}$ or $\frac{A\,B}{I} = \frac{a\,b}{i}$

The quantity of light must also be the same because the surface is the same

$$(A+B)\,L = (a+b)\,l$$

If the economy must also be the same then $E\,I = e\,i$. $\frac{E^2}{R} = \frac{e^2}{r}$

$$\frac{E^2 AB}{L} = \frac{e^2 a\,b}{l}$$

Now admitting these we can proceed thus

$- \quad I = \frac{el}{R}$ $\qquad I = \left(\frac{e}{R}\right) i$

$- \quad R = \left[\frac{R}{I}\right] = \left[\frac{R}{el}\right] = \left[\frac{R}{e}\right] l$ $\qquad R = \left[\frac{R}{e}\right]^2 r$

$- \quad S = \left(\frac{I}{e}\right) s = \left[\frac{e}{E}\right] s$ $\qquad S = \left[\frac{e}{E}\right] s$

or $AB = \left[\frac{e}{E}\right] s$

$- \quad \frac{L}{SR} = \frac{l}{sr}$ $\quad L = \frac{e}{E} s \cdot \frac{E^2}{e^2} r \times \frac{l}{sr}$ $\qquad L = \left(\frac{E}{e}\right) l$

$- \quad (A+B) L = (a+b) l$ $\qquad A+B = \left(\frac{e}{E}\right)(a+b)$

Application :- To make a lamp of 16 candles & 68 Volts

Given $e = 105$ $\quad r = 125$ $\quad i = \frac{e}{r} = 0.84$

$a = \frac{13}{1000}$ $\quad b = \frac{9}{1000}$ or $a = 0.13$. $b = 0.205$. $l = 154$

$a \times l = .167$. $a + b = 0.335$

Result. $E = 68$ $\quad I\ 1.3$. $R = 52.42$

$S = .10797$. $L = 99.7$

$AB = .10797$ $\qquad A + B = .821$

$A = .656$ $\quad B = .165$

Quantity of light – for the same intensity – the quantity of light is proportional to the number of candles

$(A+B) L = \frac{N}{a}(a+b)$ –

$$\begin{array}{r} \cdot 2165 \\ \cdot 300 \\ \hline \cdot 07165 \\ 12\cdot 17 \\ \hline 36\,1\,5\,5 \\ 5\,1\,6\,5 \\ \hline 5\,1\,6\,5 \\ \hline 5\cdot 2\,5\,2\,8\,0\,5 \end{array} \qquad \begin{array}{r} \cdot 203 \\ \cdot 343 \\ \hline \cdot 5\,4\,6 \\ 1\cdot 12 \\ \hline 2\,7\,3\,0 \\ 5\,4\,6 \\ \hline 5\,7\cdot 3\,5\,0 \end{array}$$

General equation:

$$I = \frac{N}{n}\,\frac{e}{E}\,v \qquad I = \left(\frac{E}{e}\right) l$$

$$R = \frac{n}{N}\left(\frac{E}{e}\right)^2 r \qquad A + B = \frac{N}{n}\,\frac{e}{E}\,(a + b.)$$

$$AB = \frac{N}{n}\,\frac{e}{E}\,ab.$$

Wanted a lamp of 6 Volts and 10 Candles

Same cenny a. Ou 6 x 00F x 0125 —

Given $e = 103$ $r = 125$ $a = \cdot 203$ $b. = 0\cdot 343$

$l = 154$ $E = 68$ $N = 10$ $i = \cdot 224$

$$I = \frac{N}{n} \times \frac{e}{E} \times i = \frac{10}{16} \times \frac{103}{68} \times \cdot 224 = \cdot 965 \times \cdot 224 = \cdot 2165$$

$$R = \frac{n}{N}\left(\frac{E}{e}\right)^2 r = \frac{16}{10} \times \frac{68^2}{103^2} \times 125 = 16\cdot 25$$

$$I = \left(\frac{E}{e}\right) \times l = \frac{68}{103} \times 154 = 101\cdot 7 \text{ Ohm}$$

$$AB = \frac{N}{n} \times \frac{e}{E} \times ab. = \frac{10}{16} \times \frac{103}{68} \times \overset{\cdot 06965}{(\cdot 203 \times \cdot 343)} = 0\cdot 06968$$

$$A + B = \frac{N}{n}\,\frac{e}{E}\,(a + b) = \frac{10}{16} \times \frac{103}{68} \times (\cdot 203 + \cdot 343) = \cdot 5165$$

$A = \cdot 2165$ $B = \cdot 300$

It's evident that for the same luminous intensity the quantity of light is proportional to the radiating surface

I = length	l = length
Standard type $S = AB$ = section	$a - ab$ = section
I.E.R. = Elect. constants.	i.e.r. constants
N = candles	n candles
$D = \frac{I}{AB}$ = density of current	$d = \frac{i}{ab}$ = density of lamp to get

$$\frac{ci}{R} = \frac{EI}{N} \qquad \frac{(a+b)d}{n} = \frac{(A+B)D}{N}$$

$$\therefore \frac{ci}{EI} = \frac{n}{N} \quad \text{also} \quad \frac{(a+b)d}{(A+B)D} = \frac{n}{N}$$

As e & n are generally given we can say that

$$i = \left(\frac{n}{N}\,\frac{E}{e}\right) I \qquad r = \left(\frac{N}{n}\,\frac{e^2}{E^2}\right) R$$

$$l = \left(\frac{n}{N}\right) \times I$$

$$a + b = \frac{n}{N}\,\frac{l}{I}\,(A+B)$$

$$ab = \frac{n}{N}\,\frac{l}{I}\,\frac{E^2}{e^2}\,AB$$

$$\frac{l}{ab}\,\rho = \left(\frac{n}{N}\,\frac{e^2}{E^2}\right)\frac{I}{AB}\,\rho$$ ρ being a coefficient which takes into consideration new hot & shrinkage.

during carbonization we shall have

$$\frac{ab}{AB}\,\frac{l}{I}\,\frac{E^2}{e^2} = \frac{n}{N} \qquad \frac{a+b}{A+B}\,\frac{e}{I} = \frac{n}{N}$$

Law of incandescence – X

It seem to result from maps made till now that for the same luminous intensity the amount quantity of energy for candle is constant (if we keep the same surface for candle as we have in the 8 X 13½ filament we are sure of an life and if we give the same surface per candle for all lamps we are sure of life) Now on electromotive force being always constant the ampere will be proportional to the number of lamps

Then. $EI = N(ei)$ $\quad ei = n(ei)$

$$\frac{EI}{N} = \frac{ei}{n} \qquad E = e.$$

$$\frac{I}{N} = \frac{i}{n} \qquad \frac{I}{i} = \frac{N}{n} = \frac{A+B}{a+b}$$

$$\frac{R \times I^2}{r\,i^2} = \frac{N}{n} \quad \text{i.e.} \quad \frac{R}{r} = \frac{N}{n}$$

$$\frac{I}{i}\,\frac{ab}{AB} = \frac{n}{N}$$

i.e. $\frac{A+B}{a+b} = \frac{N}{n} = \frac{I}{i} = \frac{a}{A} = \frac{AB}{ab}\,\frac{i}{I}$

Then it results that the greater the section the larger it must be – for intensity of current being same the density of the current will be smaller

Then for a lamp of 50 candles the dimensions would be as follows:—

Given:- $e = 103$ $R = 125$ $i = \cdot 824$ $n = 16$

$a = \cdot 203$ $b = \cdot 343$ $l = 1514$ $ab \cdot 07 = \cdot 06969$

Given also:- $E \cdot 103$. $N = 50$

Then

$$R = \frac{n}{N} \cdot \frac{E^2}{e^2} a = \frac{16}{50} \times \frac{103^2}{103^2} \times 125 = \cdot 32 \times 125 = 40$$

$$I = \frac{N}{n} \times \frac{e}{E} \times i = \frac{50}{16} \times \cdot 824 = 2 \cdot 57 \quad 2 \cdot 6 \text{ ft. amp.}$$

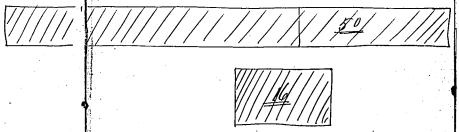
$$I_1 = \frac{E}{e} \times l = 1514 \text{ ---}$$

$$AB = \frac{N}{n} \times \frac{e}{E} \times ab = \frac{50}{16} \times (a \times b) = \cdot 21984$$

$$A + B = \frac{N}{n} \times \frac{e}{E} \times (a + b) = \frac{50}{16} \times (a + b) = \cdot 771$$

$$A = \cdot 140$$

$$B = 1 \cdot 570$$



For 6 lbs

1 R = 13 = ohm

then 13 ÷ 6 = 2·166 total machine

Surface 177 inch

$24^2 \times ·209 = 120$ HU

$120 \div 177 =$ ·68 HU per inch

see page.

Lamps a Incandescence.

As we have decided that the surface per candle in the lamp of 16 candles cannot be decreased what is the best form of section that will use the least current?

(16 candle lamp section 0.203 X 0.343)

16 candle.	Section	Surface	
·203 x ·343	·069629	1.092	
·273 X ·273	·074529	1.092	

Density of current in each case:

$\cdot 203 \times \cdot 343 = \frac{1000000}{\cdot 069629} = 14.50 \times \cdot 75 =$ or 10.875

$\cdot 273 \times \cdot 273 = \frac{1000000}{\cdot 074529} = 13.42 \times \cdot 75 = 10.065$

Thus for 16 candle as we make it now the density of current is 10.875 ampere per millimeter square whilst with same surface with a square section we ~~so~~ have only 10.065 per mm carré.

50 light Machine of 500 Volts

Ordinary 50 light

$E = 110$ D ·152 N 4

M = ·61 C ·54 Resis ·486 ohm

L = ·220 R 1500 (Wire 12/10 [illegible])

outside diameter ·180

113 × 4 × 2 = 9·04 in sqrs.

40 amp ÷ 9·04 = 4·4 per sqrs in

Suppose 1 wire 16 times round.

then $E = M \times L \times V =$

$$·61 \times \frac{220 \times 4 \times 16 \times 54}{12} \times \frac{\overset{25}{1500} \times ·152}{\underset{1}{60}} =$$

$$·61 \times 190·08 \times 3·8 = 440·61 \text{ Volts}$$

Carrying 8 amperes 8 times be only 3 amp per 16 in circle

But volts not sufficient Resist 3 ohms

If I take 12/10 I can get 5 wires in same space as 40 of 12/10 in: (10 + 3 × 5 = 65) 12 × 3 × 4 = 6.0

the room I have is 152 × 3·14 = ·4774

·4774 − 2 × 54 for pins = ·369 ÷ 54 = 6·8 in

then N = 20

$$E = ·61 \times \frac{220 \times 20 \times 54}{12} \times 3·8 = ·61 \times 2376 \times 3·8 =$$

746 × 246 = 183516

·273

= 64%

Now to send 38 Amperes

Suppose we say 12 ohms

Then

110 / 24 = 4.6 38 / 4.6 =

9 layers of 16 wire

9816 feet = 24 ohms

4908 feet each core

4908 ÷ 9 = 545 feet each layer.
